

EcoBay® Enclosure
End Market: Enterprise Computing and Storage Systems

In addition, to propel its ODM programs into the enterprise computing and storage market, last year Sanmina-SCI acquired Newisys®, a developer of enterprise-class servers and a leader in standards-based, high-performance server designs. The combination of Sanmina-SCI's build-to-order (BTO), configure-to-order (CTO), manufacturing competencies and Newisys design talent, drive the development of enterprise-class server technologies – enabling greater levels of system and power management and modular scalability. Today, Sanmina-SCI is already shipping a family of servers based on the Opteron™ technology.

The Company is also pursuing its ODM model in the communications industry. As this sector adopts open standards-based platforms in lieu of proprietary systems, ATCA is expected to gain significant momentum. The Company recently announced joint ventures with photonics OEMs, developing advanced optical modules. One example includes a joint effort to design, industrialize, manufacture and market a Tunable All-optical Signal Regeneration (TASR) product line. The design is currently being done in a collaborative manner, leveraging the significant development and industrialization strengths of both organizations.

Sanmina-SCI's ODM strategy is a key element in its customer-focused EMS business model. Due to its industry leadership, BTO and CTO expertise, and complete end-to-end manufacturing solutions, the Company expects to capitalize on this sizeable growth opportunity.
